1.4 Version, the search function does not support UTF-I characters,

for example, search for "???????" after press the search button, the search box display "å##ä⁰-ä, #æµ·å¹¿å·#", and the result returns as follows, "Your search for "å##ä⁰-ä, #æµ·å¹¿å·#" returned 0 results"

the search function in 1.3 version works better than 1.4. Although it has some UTF-8 display matters, but i can return the right result by the search function in version 1.3.

Also the download as pdf for wiki documents does not support UTF-8, as said here: <http://www.jivesoftware.com/issues/browse/CS-1033> . One wiki called confluence need to upload some UTF-8 fonts like song font to support related characters, maybe jive can try this method too.

thanks.

Winston

Hi Winston,

Search function does not support UTF-8...

We are working on UTF-8 integration in many parts of our application. Thanks for the heads up with the search functionality.
