Hello,

To develop my first plugin for Jive, I want to install the application on my ubuntu desktop. After few hours, I couldn't manage to get it installed. Here is my installation procedure and errors I got during the installation. Anyone went through these kind of issues? Thanks in advance for your help.

Procedure:

- Download the .rpm
- Convert the .rpm with alien : `alien - k --scripts jive_sbs_employee-3.0.3.SLES-10.i586`
- Install the package : `sudo dpkg -i jive-sbs_3.0.3-85364_i386.deb`

Errors :

```
touch: cannot touch `/var/lock/subsys/jive-database': No such file or directoryConfiguring
scheduled database maintenance.Configuring log rotation maintenance.Staging Jive
Application.Validating configuration.HTTPD configuration template not found. Expected
at '/usr/local/jive/etc/httpd/sites/site.template'.Creation of Jive SBS application failed.
Please check the error logs at '/usr/local/jive/var/logs/sbs.log'.Starting Jive applications.No
applications found at /usr/local/jive/applicationsStarting jive-httpd: jive-httpd: Could not open
configuration file /usr/local/jive/etc/httpd/conf/httpd.conf: No such file or directory
```

Hi,

Installation on Ubuntu

I ran into the same problem. Is there someone out there who can solve this?

Best regards,

Sönke

Hey there,

I have a feeling that this has to do with the conversion process. Can you please try running alien again with -d instead of -k? Let me know if that helps anyway, otherwise we'll dive deeper!

Thanks,

Brad
