I'm looking for more information about access management and Jive for external use.

1) What are the known issues (gaps) when using Jive to manage access? (i.e. inability to handle whitelist functionality)

2) What access management tools have been used in conjunction with Jive?

2a) What issues have occurred, if any, with that integration?

3) What are the preferred (if any) access management tools to use in conjunction with Jive?

Thanks!

Natalie
